REMARKS

A mild, rainy winter meant that bud break came early in 2014. The spring growing period was stop-start, with substantial temperature variations. The flowering period, however, took place in ideal weather conditions. The summer was somewhat gloomy, with regular rainfall and cool temperatures delaying the point where the vines stop growing. The bunches continued to swell and ripening was late in coming, while the risk posed by various pathogens meant that the vines required constant supervision. August, usually a quiet month for winemakers, was taken up with meticulous pruning in the vineyards. But September turned out to be warmer than August, as it had been in 1949, 1985 and a few more of the great 20th-century vintages. This miraculous late ripening period, which stretched right into late October, allowed the grapes to reach peak maturity in optimal health, enabling us to harvest fruit of exceptional quality and balance.
